

HOW TO USE IT

VinylVault

A field guide to scanning, grading, and organising your vinyl collection — written for anyone, not just the person who built it.

⚡ Quick Start

The fastest way from "record in hand" to "record in your collection," in three steps.

1

Identify the record

On the **Scan / Search** tab, either snap a photo of the label or runout groove, scan the barcode, or just type in the catalogue number, matrix code, or artist & album name. VinylVault looks it up against Discogs, MusicBrainz, and AI research to fill in the details — pressing year, country, label, tracklist, and an estimated value.

2

Grade the copy in your hands

The record it found is a reference — *your* actual copy might be scuffed, mint, or missing its OBI strip. Set the Media and Sleeve grade (using the standard Goldmine scale, see below), note any inserts or damage, and the valuation adjusts automatically.

3

Save it to your shelf

Hit **Save to Shelf**. It's now searchable, filterable, and — if you set up a storage Box — filed by exactly where it physically lives.

Three Ways to Identify a Record

Camera

Point it at the record's runout groove (the etched matrix code near the label) or the label itself. Works from a file upload too if your browser can't access the camera.

Tip: press `Esc` or tap anywhere outside the frame to back out without taking a photo.

Barcode Scanner

Scans the EAN/UPC barcode on newer releases and box sets. If the camera can't get a clean read, there's a manual entry box right underneath — just type or paste the number.

Manual Search

Sometimes the fastest option: type the catalogue number, matrix code, record label, or just "Artist - Album" into the search fields directly.

≡ Understanding the Grade & Value

VinylVault uses the **Goldmine Grading Standard**, the same scale most record shops and Discogs sellers use. Grade both the vinyl (Media) and the cover (Sleeve) separately — a record is often not the same condition as its jacket.

GRADE	WHAT IT MEANS	ROUGHLY
M	Mint — unplayed, factory sealed	100% of value
NM	Near Mint — plays like new, tiny sleeve scuffs at most	~88%
VG+	Very Good Plus — light wear, doesn't affect playback	~75%
VG	Very Good — some surface noise on play	~55%
G	Good — noticeably worn, plays through	~35%
F/P	Fair/Poor — heavily damaged or skipping	~15%

Extra details push the value further: a present **OBI strip** (the paper band on Japanese pressings), an original **poster or booklet**, or a note like "signed by the artist" all get factored in — just describe it in the notes field and the valuation engine adjusts.

≡ Living With Your Collection

My Shelf

Every record you've saved, with search and filtering built in.

- Search by title, artist, catalogue #, or notes
- Filter by genre and style — pick multiple at once to narrow a mood ("Rock or Jazz" + "Fusion")
- Sort by value, title, year, or date added
- Export your whole collection as a CSV or JSON file, for insurance or backup

Organise: Storage Boxes

The part that answers "wait, which crate is that in?" Create named Boxes — a real crate, a shelf, a case, whatever you actually use — and file every record into one.

- Assign a Box when saving a record, or move it later from the Organise tab
- Anything not filed anywhere shows up under *Uncategorised*, so nothing's lost track of
- Deleting a Box just returns its records to *Uncategorised* — nothing is removed from your shelf

Insights

A portfolio view of the whole collection: total estimated value, your most valuable pressing, a genre breakdown, and where your records were pressed.

Cross-Device Sync

Keep your shelf identical on your phone and your laptop. Tap **Sync** in the header, generate a Vault Code on one device, then enter that same code on the other — their collections merge and stay live-updated from then on.

Treat the code like a password — anyone with it can see and edit that synced collection.

☼ A Few Things Worth Knowing

Any window can be closed with Esc

Camera, barcode scanner, sync settings, theme picker, delete confirmations — press Esc, or click outside the window, and it closes. No hunting for a tiny X button.

Your collection lives in this browser, by default

Records are stored locally unless you turn on Cross-Device Sync. That means clearing your browser's data will clear your shelf too — export a CSV/JSON backup occasionally from My Shelf if you want peace of mind, especially before syncing for the first time.

Prices are in Singapore Dollars (SGD)

All valuations are estimated in SGD. Treat them as a research starting point, not an appraisal — actual sale prices vary by buyer, condition assessment, and market timing.

Look and feel

Click the palette icon in the header to switch between four visual themes — the original warm gold, a Nordic archival look, a Swiss modernist grid, and a neon cyber studio.

Made for people with too many records and not enough shelf space.
