

HOW TO USE IT

VinylVault

How to scan, grade, and organise your vinyl collection.

⚡ Quick Start

Three steps to get a record from your hands into your collection.

1

Identify the record

On the **Scan / Search** tab, take a photo of the label or runout groove, scan the barcode, or type in the catalogue number, matrix code, or artist and album name. VinylVault checks Discogs, MusicBrainz, and AI research to fill in the pressing year, country, label, tracklist, and an estimated value.

2

Grade the copy in your hands

What it found is a reference copy — yours might be scuffed, mint, or missing its OBI strip. Set the Media and Sleeve grade using the Goldmine scale (see below), note any inserts or damage, and the value updates automatically.

3

Save it to your shelf

Press **Save to Shelf**. From there it's searchable, filterable, and filed under a storage Box if you've set one up.

Three Ways to Identify a Record

Camera

Point it at the runout groove (the etched matrix code near the label) or the label itself. If your browser can't access the camera, upload a photo file instead.

Tip: press `Esc`, or tap outside the frame, to close it without taking a photo.

Barcode Scanner

Reads the EAN/UPC barcode on newer releases and box sets. If the camera can't get a clean read, type or paste the number into the manual entry box underneath.

Manual Search

Type the catalogue number, matrix code, record label, or "Artist - Album" directly into the search field.

± Understanding the Grade & Value

VinylVault uses the **Goldmine Grading Standard**, the same scale most record shops and Discogs sellers use. Grade the vinyl (Media) and the cover (Sleeve) separately, since they're often not in the same condition.

GRADE	WHAT IT MEANS	ROUGHLY
M	Mint — unplayed, factory sealed	100% of value
NM	Near Mint — plays like new, tiny sleeve scuffs at most	~88%
VG+	Very Good Plus — light wear, doesn't affect playback	~75%
VG	Very Good — some surface noise on play	~55%
G	Good — noticeably worn, plays through	~35%
F/P	Fair/Poor — heavily damaged or skipping	~15%

Extra details add to the value too: an **OBI strip** (the paper band on Japanese pressings), an original **poster or booklet**, or a note like "signed by the artist." Describe it in the notes field and the valuation adjusts.

≡ Living With Your Collection

My Shelf

Every record you've saved, with search and filtering built in.

- Search by title, artist, catalogue #, or notes
- Filter by genre and style — pick more than one to narrow it down (e.g. "Rock or Jazz" + "Fusion")
- Sort by value, title, year, or date added
- Export your whole collection as a CSV or JSON file, for backup

Organise: Storage Boxes

Keep track of which crate, shelf, or case a record is actually in. Create named Boxes and file each record into one.

- Assign a Box when saving a record, or move it later from the Organise tab
- Anything not filed goes under *Uncategorised*, so nothing gets lost
- Deleting a Box returns its records to *Uncategorised* — nothing is removed from your shelf

Insights

A portfolio view of your whole collection: total estimated value, your most valuable pressing, a genre breakdown, and where your records were pressed.

Cross-Device Sync

Keep your shelf identical on your phone and your laptop. Tap **Sync** in the header, generate a Vault Code on one device, then enter that same code on the other. The two collections merge and stay updated after that.

Treat the code like a password — anyone with it can see and edit that synced collection.

Command Palette

Press **Ctrl + K** (**Cmd + K** on Mac) anywhere in the app, or click the **%K** button in the header. Type to jump to any tab, open Sync or Theme settings, or find and edit a specific record without leaving the keyboard.

⚡ A Few Things Worth Knowing

Any window can be closed with Esc

Camera, barcode scanner, sync settings, theme picker, delete confirmations, command palette — press **Esc**, or click outside the window, and it closes.

Your collection lives in this browser by default

Records are stored locally unless you turn on Cross-Device Sync. Clearing your browser's data will clear your shelf too, so export a CSV/JSON backup from My Shelf now and then, especially before syncing for the first time.

Prices are in Singapore Dollars (SGD)

All valuations are estimated in SGD. Treat them as a starting point for research, not an appraisal — actual sale prices vary by buyer, condition assessment, and market timing.

Changing the look

Click the palette icon in the header to switch between four visual themes: the original warm gold, a Nordic archival look, a Swiss modernist grid, and a neon cyber studio.
